---

Hi Esther,

I am reaching out to you today regarding the CA EPA's public hearing to determine the "safe" GLYPHOSATE exposure level to put on the CA PROP 65 Carcinogen List.

I urge you to oppose any Glyphosate on the 65 Carcinogen List as there are no safe levels of Glyphosate that can be in the human body at any time. The proposed level is 1100 micrograms No Significant Risk Level (NSRL) of glyphosate, an ingredient in RoundUp. Studies show 1100 micrograms daily to be far too high of an exposure level. In comparison, chemical 2,3,7,8-Tetrachlorodibenzo-p -dioxin (TCDD), also on the Prop 65 list, has an NSRL Of .000005 micrograms per day. Because glyphosate has been shown to bioaccumulate and has been shown in [the parts per trillion](#), to increase the growth of breast cancer cells, the reality is that there is no safe level of glyphosate exposure to humans, especially babies.

Hopeful,

Geline Coulbourne
